New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell interactions.

Claim 1; SEQ ID NO 42697; 21pp + Sequence Listing; English.

The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher enkaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL1616-ABL30511), expressed DNA sequences (ABL16176-ABL30511), expressed DNA ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published\_pct\_sequences

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Description
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 1

//done differentiating somatic embryos cultered on MSM6AC.
The library was prepared using the Stratagene pBluescript
II SK(+) library construction Xit. Complementary DNA was
synthesized from mRNA using a primer consisting of a
poly(dT) sequence with an XhoI restriction site. EcoRI
adaptors were ligated to the blunt-ended cDNA fragments
followed by XhoI digestion. The cDNA fragments were
followed by XhoI digestion. The cDNA fragments
followed by Storiction site of the pBluescript vector. The ligated cDNA fragments
were transformed into the Booll-XhoI restriction site
of the pBluescript vector. The ligated cDNA fragments
were transformed into z.coli slettroMax DH10B host cells.
Tissue culture and library construction were performed by
Francoise Thibaud-Nissen and Anu Khana (Lila Vodkin lab,

/note="Vector: paluescript II SK+; Site 1: EcoR1; Site 2:
/note="Vector: paluescript II SK+; Site 1: EcoR1; Site 2:
Xho1; The cDNA library was constructed from mRNA isolated
from degenerating cotyledons of 2 week old seedlings from
P1468916. Complementary DNA was synthesized from mRNA
using a primer consisting of a poly(dr) sequence with a
Xho1 restriction site. EcoR1 adapters were ligated to the
blunt-ended cDNA fragments followed by Xho1 digestion.
The cDNA fragments were directionally cloned into the
EcoR1-Xho1 restriction site of the paluescript vector. The
ligated cDNA fragments were transformed into DH10B host
cells (GibcoBRL). This library was constructed in the
laboratory of Dr. Randy Shoemaker."

/note="Westor: PWD42Dry; Purified genomic DNA from M.
musculus C57BL/6J (male) was obtained from the Jackson
Laboratory Mouse DNA Resource
(http://www.jax.org/resources/documents/dnares/). The DNA
was hydrodynamically sheared by repeated passage through a
0.005 inch orifice at constant velocity. The sheared DNA
was blunt end-repaired with T4 DNA polymerase and T4
polymucleotide kinase. Adaptor oligomicleotides were
ligated to the blunt ends in high molar excess. The
adaptored DNA was purified and size-selected for a 9.5 to
10.5 kb range using preparative agarose gel
electrophoresis. Vector DNA was prepared from a derivative
of pWD42 (gi|4732114|gb|AF129072.1), a copy number
inducible derivative of plasmid R1. The vector was ligated
with adaptors complementary to the insert adaptors and
purified. The sheared, adaptored mouse DNA was annealed to

No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Description

Determination of this BAC-end sequence was carried out as part of collaboration with the European Drosophila Genome Project (EDGP) - http://www.edgp.ebi.ac.uk -. This Drosophila melanogaster BAC library (Dros BAC) was made by Alain Billaud at CEPH (Centre d'Etude du Polymorphisme Humain) with funding provided by a MRC project grant. The DNA was prepared from embryos by Alain Bucheton and Genevieve Payan. It has been constructed in the vector
Spermatophyta; Magnoliophyta; Liliopsida; Poales; Poaceae; PACCAD clade; Panicoideae; Andropogoneae; Zea.

/clone lib-shotgun sub-library sequences were obtained
from sheared BAC DNA subcloned into the Smal site of
pUG18. The template DNA for sequencing was obtained by PCR
using universal primers. Sequencing reactions were primed
from the PUC-C primer site (CAGGAAACAGCTATGACCATGATTACGA)
in the pUG18 polylinker."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            AZ045411 491 bp DNA linear GSS 14-MAR-2000 T234004b shotgun sub-library of BAC clone 10M16 Medicago truncatula genomic clone 10M16-004, genomic survey sequence.

/ parasites, and leukocytes removed by passage over
microcrystalline cellidose collumns. Total RNA was
record strand supparated on the presence of
size-fractionated clone with Pfu DNA polymerase and EcoRI
adaptors ligated to the blunt ends. The sample was cleaved
with Xnol and separated on a Sephacryl S-500 column.
Size-fractionated clone was pagent was cleaved arms.
After packaging, the phagemid vector (pAD-GAL4) was
excised from the HybriZAP vector and plasmid DNA
                                                                                                                                                                                                                                                                                                              Plasmodium yoelii yoelii

Bukaryota; Alveolata; Apicomplexa; Haemosporida; Plasmodium.

New system comprising isolated protein and nucleic acid, and a detection system that indicates a change in binding of the protein to the nucleic acid in the presence of the analyte, useful for detecting the presence of analyte in a sample.

Claim 35; Page 15; 36pp; English.

The invention relates to a new system (biosensor) for detecting the presence of analyte in a sample comprising: (1) an isolated protein that specifically binds the analyte; (2) an isolated nucleic acid containing a specific binding sequence that is bound specifically by the protein; and (3) a detection system that indicates a change in binding of the protein to the nucleic acid in the presence of the analyte. Also included are a biosensor device for detecting the presence of a analyte in a sample, detecting the presence of an analyte in a sample, detecting the presence of an analyte in a sample, and the arsenic resistance operno of E. coli) protein comprising an amino acid sequence that is at least 90% identical to amino acids 1-97 of the ArsR sequence appearing as ABU63440 binding to a nucleic acid

sequence comprising oligonucleotides appearing as ACD28584-ACD28591. The system is useful for detecting the presence of analyte in a sample. The present sequence is the bottom strand of an oligonucleotide which binds to a chromosomally expressed ArsR protein and is used in the biosensor of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  presence of analyte in a sample comprising: (1) an isolated protein that specifically binding the analyte; (2) an isolated mucleic acid containing a specifically binding sequence that is bound specifically by the protein; and (3) a detection system that indicates a change in binding of the protein; and biosensor device for detecting the presence of an analyte, Also included are a biosensor device for detecting the presence of an analyte in a sample, detecting the presence of an analyte in a sample, and an are comprising an anno acid sequence that is at least 90% identical to amino acids 1-97 of the ArsR sequence appearing as ABU63440 binding to a nucleic acid sequence appearing as ABU63440 binding to a nucleic acid system is useful for detecting the presence of analyte in a sample. The presence comprising oligomicleotides appearing as ABU63460 binding to a nucleic acid system is useful for detecting the presence of analyte in a sample. The present sequence is the top strand of an oligomicleotide which binds to a chromosomally expressed ArsR protein and is used in the biosensor of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New system comprising isolated protein and nucleic acid, and a detection system that indicates a change in binding of the protein to the nucleic acid in the presence of the analyte, useful for detecting the presence of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a new system (biosensor) for detecting the

The invention relates to a new system (biosensor) for detecting the presence of analyte in a sample comprising: (1) an isolated protein that specifically binds the analyte; (2) an isolated nucleic acid containing a specifically binds the analyte; (2) an isolated nucleic acid containing a specific binding sequence that is bound specifically by the protein; and (3) a detection system that indicates a change in binding of the protein; or the mucleic acid in the presence of the analyte. Also included are a biosensor device for detecting the presence of an analyte in a sample, and an Arsk (encoded by detecting the presence of an analyte in a sample, and one of a sequence that is at least 90% identical to amino acids 1-97 of the Arsk sequence appearing as ABG540 binding to a nucleic acid the Arsk sequence appearing as ABG540 binding to a nucleic acid sequence comprising ollgomucleotides appearing as ABG5864-ACD28591. The system is useful for detecting the presence of analyte in a sample. The present sequence is the bottom strand of an oligomucleotide which binds to a chromosomally expressed Arsk protein and is used in the biosensor of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      system comprising isolated protein and nucleic acid, and a detection sem that indicates a change in binding of the protein to the nucleic in the presence of the analyte, useful for detecting the presence of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          õ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              cn 100.0%; Score 25; DB 8; Length 40; 1 Similarity 100.0%; Pred. ```
The invention relates to a new system (biosensor) for detecting the presence of analyte in a sample comprising: (1) an isolated protein that presence of analyte in a sample comprising: (1) an isolated protein that specifically binds the analyte; (2) an isolated nucleic acid containing a specific binding sequence that is bound specifically by the protein; and (3) a detection system that indicates a change in binding of the protein: or the nucleic acid in the presence of the analyte. Also included are a biosensor device for detecting the presence of an analyte in a sample, detecting the presence of an analyte in a sample, at the area of the order order of the order of th
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New system comprising isolated protein and nucleic acid, and a detection system that indicates a change in binding of the protein to the nucleic acid in the presence of the analyte, useful for detecting the presence of
                                                                                                                                                                                                                        ArsR; arsenic resistance operon; biosensor; ss; arsenic
                                                                                                                                                      E. coli ArsR binding oligonucleotide CHROMLIT,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Claim 35; Page 15; 36pp; English.

Prokaryotic essential gene antisense oligonucleotide #3339.

Antisense; ss; prokaryotic essential gene; cell proliferation;

```
The invention relates to an isolated mucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression of the mucleic acid inhibite proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid condaining the vector; (3) an isolated condaining the vector; (3) an isolated polypeptide whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding collypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation, (7) identifying a compound that influences the activity of the gene product or that has an activity against a biological pathway required for proliferation, or that that inhibits cellular proliferation, (6) identifying a gene required for cellular proliferation or the biological pathway required for proliferation, or that thinbits cellular proliferation of an organism acts; (9) manufacturing an antibicit; (10) profiling a compound that inhibits proliferation of an organism acts; (9) manufacturing an antibicit; (10) profiling a compound that inhibits or organism acts; (9) manufacturing an antibicit; (10) profiling a compound that inhibits the product is oversypressed or undersepressed; (12) determining the extent or to which each of the strains is present in a culture or collection of strains; or (13) identifying proteins or screening for homologous nucleic acids required for cellular proliferation of an organism. The antisense nucleic acids required for a cellular proliferation of an organism. The missense mucleic acids required for cellular proliferation of the strains or for endowned an organism or screening for homologous nucleic acids required for a cellular proliferation of an organism are antible and an organism a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      screening
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aerunginosa. The present sequence is one of the 6213 antisense sequences of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained it electronic format directly from WIPO at ftp. wipo.int/pub/published_pct_sequences. (Updated on 27-OCT-2003 to standardise OS field)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to isolated polymucleotide (1) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (FKR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal crivity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in issue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations and to produce other types of data and products dependent on DNA and amino acid sequences. ANS64197-AAS94564 represent novel human diagnostic coding sequences. ANS64197-AAS94564 represent novel human diagnostic patent did not appear in the printed specification, but was obtained in the will be printed specification, but was obtained in the will be printed specification.

The invention relates to identifying a stress condition to which a plant cell has been exposed, comprising: (a) contacting nucleic acid representative of expressed polymucleotides in the plant cell with an array or probes representative of the plant cell genome; and (b) detecting a profile of expressed polymucleotides in the plant cell characteristic of a stress response. The method is useful in the production of transgenic plants. Cells and seeds and in producing plants with increased tolerance to abiotic stress. The present sequence is that of an Arabidopsis thalians stress regulated gene (ABZ12196-ABZ17574) used in methods of the invention. Note: The sequence data for this patent is not represented in the printed specification but is based on sequence information supplied to Derwent by the European Patent Office

                                                                                                                                                                                                                                                     The present invention provides a number of human immune system associated genes which are modified by the methylation of cytosines. The sequences can be used in the diagnosis and treatment of immune system discorders, including eye diseases such as retinopathy, neovascular glaucoma an amoular degeneration, arteriosclerosis, anaemia, cancer, acute myeloid leukaemia, Alzheimer's disease, Alzheijepsy, neurofibromatosis, rheumatoid arthritis, psoriasis and inflammatory/ulcerative bowel diseases. The present sequence is a gene of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to novel tumour suppressor gene, referred to as Lmt. The invention also relates to the field of cancer therapy and cancer diagnostics. The nucleic acid molecule is useful for screening a subject for the presence of an aberration in a gene encoding an LMT. The present sequence is human Lmt intron 2 DNA
                                                                                                                                     The invention relates to novel tumour suppressor gene, referred to as Lmt. The invention also relates to the field of cancer therapy and cance diagnostics. The nucleic acid molecule is useful for screening a subject for the presence of an aberration in a gene encoding an LMT. The present sequence is human Lmt intron 3 DNA

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to novel tumour suppressor gene, referred to as Limt. The invention also relates to the field of cancer therapy and cancer diagnostics. The nucleic acid molecule is useful for screening a subject for the presence of an aberration in a gene encoding an LMT. The present sequence is human Lmt reverse complement DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 226475 BP; 61024 A; 41761 C; 40916 G; 57494 T; 0 U; 25280 Other;

US-09-497-855A-37

Sequence 37, Application US/09497855A

Patent No. 6605432

GENERAL INFORMATION:

PAPLICANT: Huang, Tim

TILE OF INVENTION: HIGH-THROUGHPUT METHODS FOR DETECTING DNA METHYLATION

FILE REFRENCE: UMOBER: US/09/497,855A

CURRENT APPLICATION NUMBER: 06/120,592

PRIOR PELING DATE: 1999-02-18

PRIOR FILING DATE: 1999-02-18

PRIOR FILING DATE: 1999-02-05

NUMBER: OF SEQ ID NOS: 54

SOFTWARE: Patentin Version 3.0

SEQ ID NOS: 54
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 RESULT 6

Sequence 5, Application US/08356354

Sequence 5, Application US/08356354

Patent No. 5767364

GERERAL INFORMATION:

APPLICANT: SONNEWALD, Uwe

TITLE OF INVENTION: PREPARATION OF PLANTS WITH CHANGED SUCROSE CONCENTRATION

NUMBER OF SEQUENCES: 6

CORRESPONDENCE ADDRESS:

ADDRESSE: Ostrolenk, Paber, Gerb & Soffen

STREET: 1180 Avenue of the Americas

CITY: New York

STATE: NY

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 1986, Application US/09328352
Sequence 1986, Application US/09328352
Patent No. 6562958
GRNERAL INFORMATION:
APPLICANT: Gary L. Breton et al.
TITLE OF INVENTION: NUCLEIC AID AND AMINO ACID SEQUENCES RELATING TO ACINETOBACTER
TITLE OF INVENTION: BAUMANNII FOR DIAGNOSTICS AND THERAPEUTICS
FILE REFERENCE: GTOS9-0299.
CURRENT APPLICATION NUMBER: US/09/328,352
CURRENT FILING DATE: 1999-06-04
NUMBER OF SEQ ID NOS: 8252
SEQ ID NO 1986
LENGTH: 927
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sescription

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 68, Application US/09976594
Patent No. 6673549
GENERAL INPORMATION:
APPLICANT: Furness, Michael
APPLICANT: Buchbinder, Jenny
TITLE OF INVENTION: GENES EXPRESSED IN C3A LIVER CELL CULTURES TREATED WITH STEROIDS
                                                                                                             GENERAL INFORMATION:

GENERAL INFORMATION:

APPLICANT: SONNEWALD, UWE

TITLE OF INVENTION: BNA SEQUENCES AND PLASMIDS FOR THE

TITLE OF INVENTION: PREPARATION OF PLANTS WITH CHANGED SUCROSE CONCENTRATION

NUMBER OF SEQUENCES:

ADDRESSEE: Ostrolenk, Faber, Gerb & Soffen

STRERT: 1180 Avenue of the Americas

CITY: New York

STATE: NY

CONNTRY: US
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

New system comprising isolated protein and nucleic acid, and a detection system that indicates a change in binding of the protein to the nucleic acid in the presence of the analyte, useful for detecting the presence of analyte in a sample.

Claim 35; Page 15; 36pp; English.

The invention relates to a new system (biosensor) for detecting the presence of analyte in a sample comprising: (1) an isolated protein that specifically binds the analyte; (2) an isolated nucleic acid containing a specific binding sequence that is bound specifically by the protein; and (3) a detection system that indicates a change in binding of the protein biosensor device for detecting the presence of the analyte. Also included are biosensor device for detecting the presence of an analyte in a sample, detecting the presence of an analyte in a sample, and the areance resistance operon of E. coil) protein comprising an amino acid sequence that is at least 90% identical to amino acids 1970 of the ArsR sequence appearing as ABUG3440 binding to a nucleic acid

presence of analyte in a sample comprising: (1) an isolated protein that specifically binds the analyte: (2) an isolated nucleic acid containing a specifically binds the analyte: (2) an isolated nucleic acid containing a specific binding sequence that is bound specifically by the protein; and (3) a detection system that indicates a change in binding of the protein cto the nucleic acid in the presence of the analyte. Also included are a biosensor device for detecting the presence of the analyte. Also included are a compared to the arsenic resistence operno of R. coli) protein comprising an part of the arsenic resistence operno of R. coli) protein comprising an amino acid sequence appearing as ABUG3440 binding to a nucleic acid sequence comprising oligonucleotides appearing as ACD28584.ACD28591. The system is useful for detecting the presence of analyte in a sample. The present is equence is the bottom strand of an oligonucleotide which binds to a plasmid expressed Arsk protein and is used in the biosensor of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New system comprising isolated protein and nucleic acid, and a detection system that indicates a change in binding of the protein to the nucleic acid in the presence of the analyte, useful for detecting the presence of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ..

presence of analyte in a sample comprising: (1) an isolated protein that specifically binds the analyte; (2) an isolated mucleic acid containing a specifically binds the analyte; (2) an isolated mucleic acid containing a specific binding sequence that is bound specifically by the protein; and (3) a detection system that indicates a change in binding of the protein to the nucleic acid in the presence of the analyte. Also included are a biosensor device for detecting the presence of an analyte in a sample, and an area of the area of the area of the area of the analyte in a sample, and an Arsk (encoded by part of the areanic resistance operon of E. coll) protein comprising an amino acid sequence appearing as least 90% identical to amino acids 1-97 of the Arsk sequence appearing as ABU6340 binding to a nucleic acid system is useful for detecting the presence of analyte in a sample. The present sequence is the top strand of an oligomucleotide which binds to a plasmid expressed Arsk protein and is used in the biosensor of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New system comprising isolated protein and nucleic acid, and a detection system that indicates a change in binding of the protein to the nucleic acid in the presence of the analyte, useful for detecting the presence of

                                                                                                                                                                                                                                                                                                                                  ABN90538 to ABN93374 represent Staphylococcus epidermidis open reading frame (ORF) nucleic acid sequences which encode the amino acid sequences given in ABP35124 to ABB77960. The S. epidermidis sequences have antibacterial activity and can be used in gene therapy. The sequences can also be used in the diagnosis and treatment of bacterial infections, particularly S. epidermidis infections. The sequences can be used to screen for compounds able to interfere with the S. epidermidis life cycle or inhibit S. epidermidis infections. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the USPTO web site
                                                                                                                                                                                                                                                             Novel isolated nucleic acid encoding a Staphylococcus epidermis polypeptide, useful for diagnosing and treating bacterial infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ch 84.8%; Score 17.8; DB 6; Length 1026; 1 Similarity 90.5%; Pred. The specification describes a nucleic acid construct for transforming a plant cell. The construct comprises a promoter which is selectively cativated in cells of propagating material for a plant, operatively linked to a nucleotide sequence whose transcription leads to an alteration in the levels of polyamines produced in the transformed cells. The construct is useful for altering the levels of polyamines in a construct is useful for altering the levels of polyamines in a propagating material for a cultivated plant. Transgenic plants comprising the construct are useful in foodstuffs, pharmaceutical preparations, the construct are useful in foodstuffs, pharmaceutical preparations of the construct are useful in foodstuffs, pharmaceutical preparations, carrived from these plants are useful for the manufacture of a medicament of or use in the treatment or prophylaxis of hyperproliferative diseases, constructivally concer, Modgkin's disease, porlass, ulcerative diseases, irritable bowel syndrome and diamine/polyamine oxidase deficiency, normal construction, or prophylaxis of the lung or gut and for supporting growth in babies and young children, human immunodeficiency virus (HIV).

The created infection, and in other patients suffering from post-surgiacal creament constructs and transfusion induced suppression. The present sequence represents a high molecular weight constructs of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel nucleic acid construct for transforming a plant cell, comprises a selectively activated promoter, operatively linked to a nucleotide sequence whose transcription leads to altered polyamine levels.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to novel human secretory or membrane proteins (ADAS4072-ADAS5710) and their coding sequences (ADAS2433-ADAS4071). The coding sequences are useful in the gene therapy of diseases caused by abormalities of the proteins, e.g. cancer, inflammatory diseases, osteoporosis or neurological disease.

The amidase gene was isolated from a Comamonas testosteroni genomic DNA library using a degenerate probe based on the N-terminal amino acid sequence of the purified enzyme. The amidase is able to hydrolyse amides to carboxylates and has higher activity on ammonium adipmate than on adipamide. The enzyme is particularly useful for converting ammonium adipamete to diammonium adipate for production of nylon 6,6 or for converting 5-cyanovaleramide to 5-cyanovalerate (an intermediate for caprolactam used to make nylon-6). (Updated on 25-MAR-2003 to correct PN field.) (Updated on 25-MAR-2003 to correct PN field.) (Updated on 16-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; immune system disease; cytosine methylation; antiasthmatic; antianzericsclerotic; antianaemic; cytostatic; nootropic; neuroprotective; anti-HIV; anticonvulsant; ophthalmological; antirheumatic; antiatitic; antidiabetic; antisoriatic; antinflammatory; cancer; eye disease; arteriosclerosis; anaemia; acute myeloid leukaemia; Alzheimer's disease; AIDS; epilepsy; neurofibromatosis; rheumatoid arthritis; psoriasis; bowel disease; gene;
                                                                                                                                                                                                                                                                                                                                                                                                                                         New amidase with greater activity on adipamate than on adipamide - a related DNA and microorganisms producing it, partic used to produce ammonium adipate or 5-cyanovalerate for nylon mfr.

The present invention provides a number of human immune system associated genes which are modified by the methylation of cytosines. The sequences can be used in the diagnosis and treatment of immune system disorders, including eye diseases such as retinopathy, neovascular glaucoma and macular degeneration, arteriosclerosis, anaemia, cancer, acute myeloid theuxemia, Alzheimer's disease, AlDs, epilepsy, neurofibromatosis, rheumatoid arthritis, psoriasis and inflammatory/ulcerative bowel diseases. The present sequence is a gene of the invention
                                                                                                                                                                                                                                    for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Genomic library for identifying diagnostic and therapeutic compositions

                                                                 The present invention relates to a Moraxella catarrhalis genomic library comprising of a combination of 41 nucleic acid molecules (see AAF28514-AAF2854). The library has a number of uses described in the specification e.g. is useful for aidentifying diagnostic and therapeutic compositions. M. catarrhalis (Branhamella catarrhalis) is a large aerobic, gram-negative diplococcus, normally found among the bacterial flora of human upper airways. M. catarrhalis is known to cause acute, localised infections such as otitis media, sinustiis and bronchopulmonary infection and life-threatening, systemic diseases including endocarditis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human genome; biallelic marker; high density disequilibrium map; genomic map; haplotype; phenotype; polymorphic base; genotyping; haplotyping; hybridisation; identification; characterisation; diagnosis; single nucleotide polymorphism; SNP; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel biallelic markers used to construct a high density disequilibrium

AAZ65654 to AAZ69578 represent human biallelic markers from the present invention, which contain a polymorphic base at postition 24 of their nucleotide sequences. AAZ69579 to AAZ77440 represent amplification primers for the biallelic markers. The biallelic markers of the invention

```
The present invention describes a composition (1) comprising: carriers and immunostimulants; and a polypeptide (11) of a ovarian tumour perspective encoded by a polynucleotide (111) having a cDNA sequence (S1) from the 10912 nucleotide sequences as given in ABL77023 to ABL87934, (III) encoding (II) having a sequence (S2), a T cell population of (II), or antigen presenting cells that express (II). (1) has cytostatic activity. An oligonucleotide (IV) that hybridises to (S1) can be used for detecting ovarian cancer in a patient's biological sample preferably serum or ovarian tissue. The method comprises contexting a biological sample from a patient with (IV), detecting the amount of polynucleotide hybridising to (IV) and comparing the amount to a predetermined cutoff value and thereby detecting ovarian cancer in the patient, where the amount of polynucleotide hybridising to (IV) is detected preferably by polymerase chain reaction (PCR). (I) comprising (III) and/or (II) is useful for stimulating and/or expanding T cells specific for an ovarian
                                                                                                                                                                                                                                                                                                                                 ö
have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and diagnostic methods, as well as the characterisation of the differential effications responses to and side effects from the differential effications responses to and side effects from the N.B. The SEQ ID NOS 2852, 2913, 2974, 3035, 3096, 3157, 3227, and 3367, are not actually given a sequence in the Sequence Listing from the

tumour protein comprising contacting T cells with (III) or (III). (III) is useful in design and preparation of ribozyme molecules for inhibiting expression of the tumour polypeptides and proteins in tumour cells; and to isolate a full length gene from a suitable library e.g., a tumour cDNA library using well known techniques
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to an isolated nucleic acid molecule (I) comprising a nucleotide sequence given in Tables 1-9 (ABV0010-ABV62213) of the specification or its complement. (I) is useful for: (a) assessing whether a patient is affilicted with prostate cancer; (b) monitoring the progression of prostate cancer; (b) monitoring the efficacy of a therapy for inhibit prostate cancer in a patient; (d) assessing the efficacy of a therapy for inhibiting prostate cancer in a patient; (e) selecting a composition for inhibiting prostate cancer in a patient; (f) assessing the prostate cell carcinogenic potential of a compound; (g) determining whether prostate cancer has metastasized in a patient; (h) assessing the aggressiveness or indolence of prostate cancer in a patient; (l) is also useful as a pharmacodyanamic or pharmacogenomic marker
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; prostate cancer; cytostatic; carcinogen; pharmacodyanamic marker; pharmacogenomic marker; gene; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel isolated nucleic acid molecule associated with cancerous state of prostate ceils and correlating with presence of prostate cancer, useful for detecting presence of prostate cancer.
                                                                                                                                                                               Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to an isolated nucleic acid molecule (I) comprising a nucleotide sequence given in Tables 1-9 (ABV00010-ABV62213) of the specification or its complement. (I) is useful for: (a) assessing whether a patient is afflicted with prostate cancer; (b) monitoring the progression of prostate cancer in a patient; (c) assessing the efficacy of a test compound to inhibit prostate cancer in a patient; (d) assessing the efficacy of a therapy for inhibiting prostate cancer in a patient; (e) selecting a composition for inhibiting prostate cancer in a patient; (f) assessing the prostate call carcinogenic potential of a compound; (g) determining whether prostate cancer has metastasized in a patient; (h) assessing the aggressiveness or indolence of prostate cancer in a patient; (l) is also useful as a pharmacodyanamic or pharmacogenomic marker
                                                                                                                                                                                                                                                                                                                   Human, prostate cancer, cytostatic, carcinogen, pharmacodyanamic marker, pharmacogenomic marker, gene, 8s.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel isolated nucleic acid molecule associated with cancerous state of prostate cells and correlating with presence of prostate cancer, useful for detecting presence of prostate cancer, stage of prostate cancer.
